SAUCEDEMO

MANUAL SOFTWARE TESTING

TEST PLAN

Project 1 – Manual Testing Portfolio

Document status	Draft – In Progress
Version	1.0
Prepared for	Manual Software Testing Portfolio
Application under test	SauceDemo (Swag Labs demo application)
Test type	Functional manual testing

Prepared as a practical portfolio document. Actual test outcomes and defects must be recorded only after tests have been executed and evidence has been collected.

Document Control

Field	Details
Document title	SauceDemo Manual Testing – Test Plan
Version	1.0
Status	Draft / In Progress
Test approach	Manual, requirements-based functional testing
Prepared by	Portfolio author

1. Introduction

This test plan describes the scope, approach, resources, and completion criteria for manual functional testing of the SauceDemo web application. The project is intended to demonstrate a structured software testing process and produce portfolio evidence such as test cases, execution results, defect reports, and screenshots.

2. Project Objectives

- Assess whether selected application features behave according to their visible requirements and expected user behaviour.
- Design and execute clear, repeatable manual test cases.
- Record actual results and assign accurate execution statuses: Pass, Fail, Blocked, or Not Run.
- Identify, reproduce, document, and report confirmed defects where unexpected behaviour is observed.
- Capture relevant screenshots to support test execution and any confirmed defects.
- Present the testing work in a clear, organised GitHub portfolio.

3. Application Overview

SauceDemo is a browser-based demonstration shopping application. Testing will focus on the user-facing shopping journey and the main functions available in the selected test environment. The application is accessed through a web browser; no access to its internal source code or production systems is assumed.

4. Scope of Testing

4.1 Features in scope

- Login: valid and invalid credentials, blank input fields, and relevant login validation messages.
- Products/inventory: successful loading of the products page and visibility of product information.
- Product interactions: viewing products and adding or removing items from the shopping cart.
- Shopping cart: cart contents, item quantities where available, and navigation between the inventory and cart pages.
- Checkout: checkout form validation and the visible checkout flow through order completion, where supported by the demo application.
- Navigation and logout: navigation between relevant pages and ability to log out.

4.2 Features out of scope

- Performance, load, stress, and scalability testing.

- Penetration testing, vulnerability scanning, and security certification.
- Source-code review, unit testing, and backend component testing.
- Testing of real payment processing, banking integrations, or real customer data.
- Exhaustive cross-browser, cross-device, and accessibility compliance testing.
- Any feature or environment that is unavailable or outside the agreed demo application.

5. Test Approach and Strategy

Testing will be performed manually using documented test cases. Test cases will include preconditions, test data where needed, execution steps, expected results, and actual results. Testing will begin with the documented scenarios and may be extended when additional relevant behaviour is observed.

- Positive testing: verify expected behaviour using valid inputs and normal user actions.
- Negative testing: verify how the application handles invalid, missing, or unexpected inputs.
- Boundary and validation checks: check relevant field validation and input constraints where applicable.
- Confirmation testing: re-test a failed scenario after a change or fix is made, if a fix becomes available.
- Regression testing: repeat relevant previously passed tests after a change that could affect existing functionality.
- Exploratory testing: perform limited, purposeful exploration to identify additional scenarios not already covered.

6. Test Environment and Tools

Item	Planned environment / tool
Application	SauceDemo demo web application
Access method	Web browser and internet connection
Browser	A current desktop browser; exact name and version to be recorded during execution
Test documentation	Excel test case workbook and this test plan
Defect tracking	Bug report template / GitHub project documentation
Evidence	Screenshots captured during actual test execution
Portfolio repository	GitHub – SauceDemo-Manual-Testing

7. Test Data

Only test credentials and sample data provided or permitted by the demo application will be used. No real personal, financial, or confidential information will be entered. Any credentials used during execution should be recorded safely in the test notes without exposing sensitive information in public screenshots.

8. Entry Criteria

- The demo application is reachable and the tester can access the relevant pages.
- The test plan and test cases are available for reference.
- Required test data and browser access are available.
- The test environment is sufficiently stable to begin execution.

9. Exit Criteria

- All planned test cases have been executed or have a clearly recorded reason for remaining Not Run or Blocked.
- Actual results and execution statuses have been recorded accurately.
- Any confirmed failures have been documented with reproducible steps and supporting evidence where possible.
- The execution summary has been updated to reflect the work actually completed.
- Known limitations and outstanding issues have been documented.

10. Defect Reporting

A defect will be reported only when unexpected behaviour has been observed and can be described clearly. Each report should include a unique ID, title, environment, preconditions, steps to reproduce, expected result, actual result, severity, priority, status, and supporting evidence where available. Suspected issues must be re-tested before being described as confirmed defects. No hypothetical defect will be presented as an actual finding.

11. Risks and Mitigations

Risk	Mitigation
Demo application is unavailable or changes.	Record the date and environment; retry later and document any blocked tests.
Test data or accounts are restricted.	Use only permitted demo data and avoid real personal information.
Browser or network issues affect results.	Record browser details, retry the scenario, and distinguish environment issues from application defects.
Insufficient evidence for a suspected defect.	Repeat the steps and capture clear screenshots before raising a confirmed defect.
Limited time prevents full execution.	Prioritise critical user journeys and clearly mark remaining cases Not Run.

12. Deliverables

- Test plan (this document).
- Test cases and test data in the project workbook.
- Test execution results and an execution summary.
- Defect reports for confirmed defects, if any are found.
- Screenshots and other supporting test evidence.
- A GitHub repository containing the project documentation and deliverables.

13. Assumptions and Limitations

This is an independent portfolio exercise using a public demo application. The tester does not control the application, its availability, test accounts, or future changes. Results apply only to the environment and date recorded during execution. This plan does not claim that the application is defect-free or that all possible scenarios have been tested.

14. Approval and Review

This document is a working test plan for a personal portfolio project. It may be updated when the scope, test environment, or approach changes. Updates should be reflected in the GitHub repository so that the PDF and the Markdown version remain consistent.
